

Aegis Protocol

On-chain security & risk-aware yield for BNB Chain.

Live on BSC Mainnet · Listed on DappBay · Built BNB-native

Founder: David Praise Francis-Omogbai

01 · THE PROBLEM

BNB Chain is the most-attacked retail surface in crypto.

The chain with the highest retail trade volume is also the chain with the highest exposure to honeypots, rugs, hidden mints, and silent LP removals. Existing tooling fails users in three ways:

- Static — a one-time risk score that doesn't notice when an owner re-enables a hidden mint a day after you bought.
- Shallow — one API in, one number out. No reasoning across liquidity, taxes, owner privileges, and holder concentration.
- Passive — lives in a dashboard the user will never open. By the time they look, the rug has happened.

\$2.8B+

LOST TO BSC RUGS & HONEYPOTS IN 2024 (CERTIK / DE.FI)

02 · WHAT AEGIS DOES

The missing security layer for BNB Chain — live now.

Guardian Shield

Real-time wallet monitoring.

Diff-aware Telegram alerts: new threat / risk escalated / risk cleared.

Silence means safe — that's the point.

AI Scanner

Every BNB Chain token, analyzed by Llama-3.3-70B via Groq.

Structured reasoning, cited evidence, logged on-chain via DecisionLogger.

Aegis Vault

Yield that prices in risk.

Live on BSC Mainnet. Rebalances away from deteriorating assets using the same signals Guardian detects.

03 · TRACTION

Two weeks from launch. Already shipping signal.

379

\$UNIQ HOLDERS

LIVE

DAPPBAY LISTED

Bootstrapped — no outside capital. Every metric earned organically.

- Listed on DappBay (BNB Chain's curated directory) within two weeks of mainnet launch.
- \$UNIQ token has 160 holders post-hackathon, driving tier-gated monitoring demand.
- Vault contract live at 0x9f60...0C06 · DecisionLogger at 0x51Be...3Da86.

04 · HOW IT WORKS

From wallet connect to Telegram alert — under 60 seconds.

- 1 Connect** User connects their BNB Chain wallet at aegisguardian.xyz.
- 2 Scan** Aegis pulls holdings via the wallet API and runs 25 risk rules across every token (honeypot, taxes, owner privileges, LP locks, holder concentration).
- 3 Reason** Gold tier triggers Groq Llama-3.3-70B for evidence-cited reasoning. Output is logged on-chain via DecisionLogger.
- 4 Monitor** Vercel cron scans every subscribed wallet every 5 minutes — 24/7, even when the page is closed.
- 5 Alert** Diff engine classifies each scan: new / escalated / resolved. Only state changes ship a Telegram message.

05 · DEFENSIBLE MOAT

Why Aegis wins where others don't.

- Diff-aware alerts — an original primitive. Competitors re-send the same alert; we stay silent until state changes. Trust compounds with every silent scan.
- On-chain AI receipts — every Llama-3.3-70B decision is logged via the DecisionLogger contract. Verifiable, not vibes.
- Closed loop — security signals don't stop at the alert. They feed the Vault's rebalance logic. No competitor ships both sides.
- Telegram-native distribution — we meet retail where they already trade. Dashboard-first competitors lose the moment.
- \$UNIQ alignment — tier-gated monitoring creates real, recurring demand for the token. Holders fund the protocol; protocol protects holders.
- BNB-native focus — deep liquidity, deep data, deep relationships. Everyone else treats BSC as a side-chain afterthought.

06 · MARKET

\$1.5B+ ARR ceiling on BNB Chain retail alone.

- TAM — ~25M monthly active BNB Chain wallets. 10% paying ~\$10/mo equivalent in \$UNIQ = ~\$3B/year.
- SAM — ~\$5B BSC DeFi TVL. Risk-priced vault capturing 1% with 10% perf fee = \$4-7.5M/yr from yield alone.
- B2B — DEXes, aggregators, and wallets need a pre-trade risk overlay. Per-scan API pricing scales with on-chain volume (>\$50M daily on BSC DEXes).
- Adjacent — every EVM chain has the same problem. Aegis ports horizontally (Ethereum, Base, Arbitrum, Polygon) once BNB Chain is owned.
- Compliance — institutional risk monitoring is a multi-billion-dollar software category (Chainalysis, TRM Labs). Aegis is the consumer-grade entry point.

07 · BUSINESS MODEL

Token-gated tiers today. B2B API & vault fees tomorrow.

Free

0 \$UNIQ

Wallet scans + token scans +
basic alerts.

Bronze

10,000 \$UNIQ

Priority cron + holder & LP
tracking.

Silver

100,000 \$UNIQ

Multi-wallet portfolios + dev
wallet surveillance + webhooks.

Gold

1,000,000 \$UNIQ

Full AI reasoning +
DecisionLogger receipts + vault
auto-rebalance + private API.

Phase 2 · B2B risk-API licensing to DEXes & wallets · 10% Vault performance fee · White-label Guardian.

08 · COMPETITION

Crowded category. Empty position.

Who's in the space

- GoPlusLabs — strong API, no product, no monitoring, no alerts.
- De.Fi (Shield) — broad EVM coverage but shallow on BSC.
- HoneyPot.is / TokenSniffer — single-scan only.
- RugDoc — manual reviews, doesn't scale.
- Wallet Guard / Pocket Universe — phishing focus, not on-chain risk.

Why none of them win

- None ship diff-aware alerts — they spam or stay quiet.
- None log AI reasoning on-chain (no DecisionLogger analog).
- None close the loop into a vault — Aegis productizes the signal.
- None are BNB-native — BSC is everyone else's afterthought.
- None bundle Telegram distribution with the analysis.

09 · FOUNDER

Solo technical founder. Hackathon-tested.

David Praise Francis-Omogbai

Founder & CEO · Full-time

Builder-first founder finishing a BSc in Computer Science (2026). Ships product end-to-end: smart contracts, indexer, AI reasoning pipeline, real-time Telegram alert system, and the dashboard — solo.

- Multiple hackathon wins — solo, no team. Track record of shipping production-ready dApps under deadline pressure.
- Portfolio of dApps published on DoraHacks · dorahacks.io/hacker/i_am_dflame
- AI-fluent builder — uses LLMs as the force-multiplier that compresses a team of 4 into one founder.
- Hiring next: technical co-founder (Solidity / audit) + Head of Growth (BNB Chain ecosystem).

10 · THE ASK

Why EASY Residency, and what we'll do with it.

- BNB Chain GTM — DappBay featured placement, Binance Square content, intros to PancakeSwap / Venus / ListaDAO / Binance Web3 Wallet for native risk-API integration.
- YZi Labs capital + 10-week residency — hire technical co-founder + Head of Growth, run first paid acquisition cohort, ship the B2B risk-API to two DEX partners.
- Mentorship — operators who've scaled BNB Chain consumer products past 100k users. Specifically: token-gated SaaS pricing, KOL rev-share, MiCA classification for \$UNIQ.

Built on BNB Chain. Built for users who'd rather not get rugged.
